                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20, Application US/09707780

Batent No. 6399308

GENERAL INFORMATION:

APPLICANT: Gonsalves, Dennis

APPLICANT: Meng, Bacabong

TITLE OF INVENTION: RUPESTRIS STEM PITTING ASSOCIATED VIRUS

TITLE OF INVENTION: NUCLEIC ACIDS, PROTEINS, AND THEIR USES

CURRENT APPLICATION NUMBER: US/09/707,780

CURRENT FILIAG DATE: 2000-11-07

PRIOR APPLICATION UMBER: 09/081,320
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10.4%; Score 44; DB 4; Length 80; 50.0%; Pred. Sequence 9, Application US/09246500B

Patent No. 623494

GENERAL INFORMATION:
APPLICATT H0911, Tony E.
TITLE OF INVENTION: Substrates for Assessing Mannan-Binding
TITLE OF INVENTION: Protein-Associated Serine Protease Activity and Methods;
TITLE OF INVENTION: Using the Substrates
FILE REFERENCE: 24730-2204

CURRENT FILING DATE: 1999-02-08

CURRENT FILING DATE: 1999-02-08

NUMBER OF SEQ ID NOS: 19

SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij

Sequence 52, Application US/08516859A
Sequence 52, Application US/08516859A
Patent No. 6069231
GENERAL INFORMATION:
TITLE OF INVENTION: Retinoblastoma Protein - Interacting
TITLE OF INVENTION: Zinc Finger Proteins
TITLE OF SEQUENCES: 106
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell & Flores LLP
STREET: A370 La Jolla Village Drive, Suite 700

```

ALIGNMENTS

```
Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.
AAB18942 standard; peptide; 84 AA.
```

08-FEB-2001 (first entry)

Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

```
Homo sapiens
```

21-SEP-2000

14-MAR-2000; 2000WO-FR00613. 99FR-0003159. 15-MAR-1999; (CNRS ) CNRS CENT NAT RECH SCI.

ö
                                                                                                                                                            B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PFR-SHZ (STC homology 2) domains of a GFD7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SHZ (which by Itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, and syndrome X.
                                                 Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

RESULT 2 AAB18938

AAB18938 standard; peptide; 84 AA. AAB18938;

Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein. 08-FEB-2001 (first entry)

Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

Rattus sp.

WO200055634-A1. 21-SEP-2000.

14-MAR-2000; 2000WO-FR00613.

99FR-0003159. 15-MAR-1999;

Burnol A, Perdereau D, Kasus-Jacobi A, Bereziat V, Girard J; (CNRS ) CNRS CENT NAT RECH SCI.

WPI; 2000-587566/55.

Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

Claim 2; Page 23-24; 46pp; French.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting

PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases that which insulin is implicated. The peptides are used for screening molecules for ability to treat diseases that are potentially useful for treating insulin associated diseases particularly diabetes and obesity but also polycystic ovarian syndrome X.
region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Against that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases the winto insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome X.

PIR is the actual binding region but its effect is about 10 times greater in presence of SHZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can refine used for screening molecules for ability to treat diseases that that are potentially useful for treating insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome and syndrome X.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2;
                                                                                                                                                                                                                                                                                                                                                                                                                                       B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SI2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptide or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease;
                                                                                                  Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SIZ (Src homology 2) domains of a Grb7 family protein. PIR sit he actual binding region but its effect is about 10 times greater in presence of SIZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases that that are potentially useful for treating insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome and syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphorylated insulin receptor interacting region; Grb7 family protein, insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Stc homology 2) domains of a Gtb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can thinkly tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases. Particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphorylated insulin receptor interacting region; Grb7 family protein insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR SIZ (Stc homology 2) domains of a Gtb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that effect binding between the peptides and the insulin receptor can talmulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases. Particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome
peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome and syndrome X.

PIR is the actual binding region but its effect is about 10 times greater in presence of SHZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine Kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, and syndrome X.
                                                                                                                                                                                                                                                   Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times affect binding between the peptides and the insulin receptor can that stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases that are potentially useful for treating insulin resoluting agents that are potentially useful for treating insulin-associated diseases.

Particularly will diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                               Phosphorylated insulin receptor interacting region; Grb7 family protein insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                           Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                           Burnol A, Perdereau D, Kasus-Jacobi A, Bereziat V, Girard J;
                Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SIZ (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SHZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, and syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                     Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodilatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                ò
                B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Stc homology 2) domains of a GFD7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases particularly diabetes and obesity but also polycystic ovarian syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cencer; leukaemia; nervous system disorders; arthritis; inflammation.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity is activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomolary; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymoleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, infinial activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to isolated polynuclectide (I) and colypeptide (II) sequences. (I) is useful as hybridisation probes, colypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain receivable in the complaint of (II). The and gene mapping, and in recombinant production of (II). The colynuclectides are also used in diagnostics as expressed sequence tags (por identifying expressed genes. (I) is useful in gene therapy techniques (II) is useful for generating antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or another in the polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful in medical contains in the polypeptide and polynucleotide sequences have applications in capture types of date and products dependent on DNA and confine acid sequences. ABG00010-ABG30377 represent novel human call sequences and products dependent on DNA and diagnostic amino acid sequences of the invention.

Confine and confine and confine and products dependent on DNA and confine and and sequences of the invention.

Confine and confine and confine and confine and confine and confine and sequences of the invention.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, accines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
  Human, cytokine; cell proliferation, cell differentiation, gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QQ
        The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynecleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopoiesis regulating activity tissue growth factor activity, immunomodulatory activity and activity to the coll and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAU91124
                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predsposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells capressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically englineered to express them are also useful for producing the proteins. They may be used to increase stem cell proliferation; to regulate haematopolesis; and in the polypeptide and cells genetically and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopolesis; and in the polypeptide and/or stimulation; as anti-inflammatory agents; and in treatment of leukamains. Auguspilo Abanasa of the invention.
                                                                                                                                                                                                                                                                        Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16; Indels 14; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shalf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and dispinsosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. alabtes), heamatopoietic disorders, mental disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). The present invention relates to the isolation of novel human secreted proteins and the polynucleotide sequences encoding them. The secreted proteins are useful to prevent, tread to amedicate encodical condition.

The e.g. humans, mice, rabbits, goats, horses, cats, doss, chickens or sheep. The secreted proteins are also useful in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the secreted proteins are also useful in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the secreted proteins and iso be used in also that associated with disorders and in diagnostic immunosasys e.g. radioimmunosasys or enzyme linked immunosorbent assays (ELISA). Disorders which can be arthitis, hyperpoliferative disorders e.g. cancer, cardioimscassular disorders e.g. cardiac arrest, cardioimscascular disorders e.g. cardiac arrest, cardioim disorders e.g. cardiac disorders e.g. parkinson's coular disorders e.g. corneal infection. The polypeptides can also be used to alm wound healing and epithalial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for sunburn, to maintain organs before transplantation, concommentally the polypeptides can also be used as a food additive or concommental purpose or decrease storage capabilities.

Augilo81-Augilu8 represent human secreted protein sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesıs; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomcdulatory; cencer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides have various cytokine-11ke activities, e.g. stem cell growth factor activity, hematopoisesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, infinibin activity and may be useful in the diagnosis and/or reatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -Claim 20; SEQ ID NO 20807; 1399pp + Sequence Listing; English.

Gland (cyanoglobin) is a peripheral membrane protein that is
restricted to certain Nostco spp.";
J. Bacteriol. 178:6587-6598(1996).
I- FUNCTION: THE KEY ENZYMATIC REACTIONS IN NITROGEN FIXATION ARE
CATALYZED BY THE NITROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THE
IRON PROTEIN AND THE MOLYBDENUM-IRON PROTEIN.
CATALYTIC ACTIVITY: 8 reduced ferredoxin + 8 H(+) + N(2) + 16 APP
8 OXIDIZED GEREFOXIN + 2 NH(3) + 16 ADP + 16 phosphate.
I- COFACTOR: BINDS ONE 4PE-4 CLUSTER PER DIMER.
I- SUBUNIT: HOMODIMER (BY SIMILARITY).

1- SIMILARITY: BELONGS TO THE NIFH / BCHL / CHLL FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Fuloning and characterization of a Pseudomonas mendocina KRI gene
cluster encoding toluene-4-monooxygenase.";
J. Bacteriol. 173:5315-5327(1991).
I- FUNCTION: HYDROXYLARES TOLORNE TO FORM P-CRESOL.
COFACTOR: FAD; REQUIRES FEC+2) FOR ACTIVITY.
I- SUBMINT: THE MULTCOMPOUND: first Step.
IS SURMED BY THE THOA, THOB, TMOC, TMOD, TMOE AND TMOF
Pfam, PF01194; RNA_pol_N; 1.
PROSITE; PS01112; RNA_POL_N_8KD; 1.
Transferase; DNA-directed RNA polymerase; Transcription; Zinc;
